                                                                                                                                                                                                                                                 A. Description: allows clpP to hydrolyze polypeptides and proteins, probably e activity; ATP hydrolysis is required for Clp hydrolysis of proteins but no C. Superfamily: endopeptidase Clp ATP-binding chain C. Keywords: ATP; chloroplast; hydrolase; molecular chaperone; nucleotide bin F, 302-309/Region: nucleotide-binding motif A (P-loop) F, 367-371/Region: nucleotide-binding motif B F, 646-653/Region: nucleotide-binding motif A (P-loop) F, 311-715/Region: nucleotide-binding motif A (P-loop)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A:5905
A:5905
A:5905
A:600peptidase Clp (EC 3.4.21.-) ATP-binding chain cd4A, chloroplast [similarity]
N:Alternate names: ATP-dependent Clp proteinase regulatory chain A; CD4A protein
N:Contains: adenosinetriphosphatase (EC 3.6.1.3)
C:Species: Lycopersicon esculentum (tomato)
C:Species: Lycopersicon esculentum (tomato)
C:Date: 30-Jun-1993 #sequence_revision 30-Jun-1993 #text_change 19-Jan-2001
